

\$ Endpoints, limits, and the migration

API

Ravi Menon

Developer Platform • September 2, 2026

\$ The surface

POST /v1/projects create

GET /v1/projects/:id read

POST /v1/compile build, returns a job

GET /v1/compile/:job poll

\$ What it is for

yes automating something you do by hand today

yes wiring the product into a pipeline you already run

no a replacement for the editor. Different job.

Migrating

\$ From the old endpoints

deprecated /jobs/:id **use** /v1/compile/:job
changed error shape **now** { error, code }
unchanged auth bearer token, as before

\$ How long the old one lives

6 months

of overlap, announced with a date rather than "soon". A deprecation without a date is one nobody plans around.

\$ Failure modes worth knowing

409 the account is at a limit its plan sets
429 slow down, the header says how long
422 the document is fine, the request is not

Open questions

\$ What is still unknown

OPEN the thing nobody has measured yet

OPEN the assumption this plan rests on

NEXT who finds out, and by when

\$ Appendix

Graphs, raw output and the commands to reproduce any of it. Kept after the close so the talk stays short and the evidence stays available.
